Truth or Dare (with a twist) — PRD

Overview

A truth-or-dare game module for the party-games platform. Instead of a fixed prompt list, the group describes their own scenario upfront, and each truth or dare is generated to fit that context and an intensity level the group sets themselves. Prompts appear as text on screen — no voice, no TTS, players read it themselves.

Goal

A truth-or-dare experience that feels tailored instead of generic, stays inside whatever intensity the group actually asked for, and plugs cleanly into the same room/turn infrastructure as the rest of the platform.

Who it's for

A group or a couple in the same room, phones as controllers — same as the platform overall. Works fine down to two players.

Core gameplay loop

1. At setup, the host fills in a short scenario description ("coworkers who just started dating," "college friends reunion"), sets an intensity level (mild / medium / wild), and picks a mode: Truth or Dare (choose each turn), Truth only, or Dare only.
2. Turn rotates across connected players, same mechanic as the rest of the platform.
3. On mixed mode, the current player picks Truth or Dare for their turn; on a fixed mode, the type is already decided.
4. A prompt is generated to match the scenario, intensity, and type, and appears as text on screen.
5. The player reads it themselves and answers or completes it — no audio involved anywhere in this game.
6. A skip button regenerates a fresh prompt of the same type, no explanation needed, if one doesn't land right for the room.
7. Turn passes to the next player.

Functional requirements (v1)

- Scenario input — free text, set once at the start of a session
- Intensity selector — mild / medium / wild, set at the start of a session

- Mode selector — Truth or Dare (mixed) / Truth only / Dare only, set at the start of a session
- Turn rotation reusing the platform's shared room/turn system
- Per-turn prompt generation using scenario + intensity + type
- Text-only display of the current prompt
- Skip/reroll, unlimited, no penalty
- Basic repeat-avoidance so the same prompt doesn't resurface in one session

Non-functional requirements

- Generation should return a prompt in a couple seconds — long waits kill the momentum
- Prompts stay short — one or two sentences, readable at a glance
- Content stays within the group's own intensity setting regardless of what the scenario text implies, and never involves anyone not actually present in the game

Out of scope (v1)

- Text-to-speech or any audio
- Per-player mode overrides — one mode applies to the whole session
- Saving scenarios or prompt history across sessions
- A human moderation step — safety is handled by the generation instructions themselves, not a review queue

Data model

Session (within a Room): `mode`, `intensity`, `scenario_text`, `used_prompts[]`

Turn: `current_player`, `prompt_type` (truth/dare), `prompt_text`

Technical approach

- One LLM call per turn: scenario, intensity, mode, and a fixed set of safety instructions go in, a short prompt comes out
- No timers, no simultaneous input, no TTS — this is the simplest game in the platform once the generation call is wired up
- Safety instructions are non-negotiable regardless of scenario or intensity: nobody outside the room, nothing that pressures disclosure of something genuinely private, dares stay physically safe and don't damage anything, and content stays non-explicit at every intensity level
- Repeat-avoidance: keep a short list of already-used prompts per session and have the model avoid them, or filter on close text matches

Build phases

1. Static first — hand-write a small set of truths/dares per intensity level, get turn order, mode selection, and skip working with zero LLM involved
2. Swap in generation — same flow, but the prompt now comes from a live call using the scenario, intensity, and type
3. Tune and polish — test the system prompt against a range of scenarios, add repeat-avoidance, decide whether prompts show to the whole room or just the current player

Open questions

- Prompt visibility — current player only, or the whole room (dares likely want witnesses, truths might want privacy)
- Concrete definitions for mild / medium / wild, not just the labels
- Which LLM powers generation — likely whatever the platform's shared call ends up being

Success criteria

- Prompts clearly reflect the scenario the group described, not generic filler
- Nobody gets a prompt that feels like it broke the room's own stated intensity
- Skip gets used occasionally, not constantly — constant skipping would mean the generation itself needs work
